

1                   ABSTRACT OF THE DISCLOSURE

2           An improved tamper evident end cap assembly for a drug  
3   loaded syringe which assembly includes a syringe cap to close  
4   the discharge port in the nozzle of the syringe and an indicator  
5   ring about the nozzle connected by chads or tabs to a tubular  
6   shield which chads or tabs are adapted to break freeing the ring  
7   from the shield to loosely wobble on the nozzle indicating  
8   tampering if an axial force of separation is applied to the  
9   syringe cap to remove it from the syringe and a one way drive  
10   mechanism engaging both the shield and syringe cap so the shield  
11   may be rotated to advance the assembly onto a syringe nozzle but  
12   which is not responsive to counter rotation to withdraw the  
13   syringe cap to open the discharge port and gain access to the  
14   drug.
